

Demo Company Security Policy v2 Update

Access management

Multi-factor authentication is required for email, source control, production systems, customer data tools, and finance systems. Admin access is reviewed every 30 days by Security Operations. Contractor access tokens expire after 14 days unless Security Operations grants a written exception.

Data handling

Production customer data may not be copied into personal laptops or personal cloud storage. Laptop disk encryption is mandatory. Secrets must be stored in 1Password and must not be pasted into Slack, ticket comments, spreadsheets, or source code repositories.

Vendor review

New vendors that process customer data require a security review before purchase. Existing high-risk vendors require an annual SOC 2 or equivalent review. Security event logs are retained for 540 days.

Incident response

For a Sev1 incident, the incident commander must notify Security Operations within 15 minutes. The security channel of record is #security-incidents.
